

AUTOMATION WORKFLOW ASSIGNMENT

Organising Photos and Videos After Every Photography Job

1. Identify a Repetitive Manual Task

Task: Organising photos and videos after a photography job.

After every photography job, I normally have to manually transfer my photos and videos, create a folder for the job, separate photos from videos, rename files when necessary, upload everything to Google Drive, and check that the upload is complete.

This task is repetitive because I perform almost the same steps after every photography job.

2. Map the Current Process Step by Step

1. Finish the photography job.
2. Transfer the photos and videos from my camera/phone.
3. Create a new folder for the photography job.
4. Separate photos from videos.
5. Rename files where necessary.
6. Upload the organised folders to Google Drive.
7. Check that all files have uploaded successfully.

Trigger: Completion of a photography job.

Manual work: Creating folders, sorting files, renaming files and uploading them.

Final result: Photos and videos are organised and safely stored in Google Drive.

3. Redesigned Automated Workflow

I would redesign the process using **Zapier and Google Drive**.

Automated Action 1: Detect the new photos and videos.

Automated Action 2: Create a folder for the photography job using the date and shoot name.

Automated Action 3: Sort photos into a **Photos** folder.

Automated Action 4: Sort videos into a **Videos** folder.

Automated Action 5: Rename files using a consistent naming format, if required.

Automated Action 6: Upload and organise the files in Google Drive.

Automated Action 7: Send a notification when the process is complete.

Expected output: A completely organised Google Drive folder, for example **Photography Jobs** → **2026-09-15 – Event Name** → **Photos / Videos**.

4. Workflow Diagram

NEW PHOTOS / VIDEOS	ZAPIER TRIGGER	CREATE JOB FOLDER	SORT FILES
After every shoot	New files detected	Date + shoot name	Photos / Videos
↓	↓	↓	↓
RENAME FILES	UPLOAD TO GOOGLE DRIVE	SEND NOTIFICATION	COMPLETED
Consistent format	Organised folders	Email/phone alert	Files safely stored

5. Short Explanation of the Automation Tool

I would use **Zapier** because it is a no-code automation platform that connects different applications and allows repetitive tasks to be automated using triggers and actions. For this workflow, Zapier can work with Google Drive to detect new files and start an automated sequence. The workflow can create and organise folders, move files, and send a notification when the process is completed. This reduces the time I spend manually organising files after every photography job.

6. Final Explanation / Submission

In conclusion, I identified organising photos and videos after every photography job as a repetitive manual task. The current process involves transferring files, creating folders, separating photos and videos, renaming files, uploading them to Google Drive and checking the upload. I redesigned this process using Zapier and Google Drive. When new files are detected, the automation creates the appropriate job folder, organises the photos and videos, uploads them to Google Drive and sends a notification when completed. This workflow saves time, reduces human error and keeps my photography files properly organised.

Tools: Zapier + Google Drive | **Frequency:** After every photography job
